
LEVELS OF NONNUTRITIVE SUBSTANCES IN FERTILIZERS

REPORT TO THE LEGISLATURE

December 1999

PREPARED BY:

WASHINGTON STATE DEPARTMENT OF AGRICULTURE
WASHINGTON STATE DEPARTMENT OF ECOLOGY

REPORT TO THE LEGISLATURE

Levels of Nonnutritive Substances in Fertilizers

(as required by RCW 15.54.433)

Prepared by the Washington State Department of Agriculture
and the Washington State Department of Ecology
December 1999

Introduction

On March 18, 1998, the Fertilizer Regulatory Act of 1998 was signed into law. One of the primary purposes of the legislation was to better protect human health and the environment by creating regulatory standards for nine heavy metals commonly found in commercial fertilizers (arsenic, cadmium, cobalt, lead, mercury, molybdenum, nickel, selenium and zinc). These standards set limits for the annual loading (addition) of these metals to soils in Washington. With this law, Washington became the first state to set clear, scientifically defined standards designed to identify and minimize contaminants in fertilizers. Since the Act's passage, only fertilizers that meet the Washington metals standards have been registered by the Department of Agriculture for distribution in the state.

Beginning July 1, 1998, companies submitting products for registration were required to submit laboratory analyses quantifying the nine regulated metals levels in their products. The law was amended in 1999 to further refine the method for submitting this information. In addition to monitoring the heavy metals content of fertilizers, the Act required the Department of Ecology, in consultation with the Department of Health and the Department of Labor and Industries, to review and make recommendations for the registration of waste-derived and micronutrient fertilizers before the Department of Agriculture could register those products. Previous studies conducted by Ecology indicated that waste-derived and micronutrient fertilizers had the highest potential for contamination with heavy metals and other pollutants. Those products recommended for registration by Ecology which meet all other requirements of the fertilizer law are registered.

Among other provisions, the Act also required the agencies to biennially prepare a report to the legislature presenting information on levels of nonnutritive substances in fertilizers and the results from agency testing of products. This is the first report to the legislature under that mandate.

Metals Content of Registered Fertilizers

As required by the Act, the Washington State Department of Agriculture (WSDA) developed a database for tracking registration information, including metals concentrations of each of the nine regulated metals in each product submitted with the registration application. Appendix A, derived from this database, lists the metals data for each fertilizer registered as of November 1, 1999. All products listed meet the Washington metals standards, most by a wide margin. The most current information regarding registered fertilizers and their metals content can be accessed via the Internet at <http://www.wa.gov/agr/pmd/fertilizers>.

A review of Appendix A shows the metals content varies greatly among registered fertilizers. In some cases, metals concentrations vary by one or even two orders of magnitude. The question which comes to mind is, how can these products all meet the Washington metals standards? The answer lies in the fact that the standards are not based solely on the amount of metals in fertilizers, but rather the amount of metals to be added to soil over time (measured in pounds/acre/year) through the application of the fertilizer. Therefore, a fertilizer that has a high concentration of a particular metal may pass the standards if only a small amount is applied to the soil. Conversely, a fertilizer with low concentrations of metals can be applied at high rates and still pass the standards. The net effect in either case is that regulated metals levels are below allowable levels as defined under RCW 15.54.800 and WAC 16-200-764.

Another variation in the metals data occurs with products which contain one or more of three metals: cobalt, molybdenum or zinc. These three metals are essential for plant growth. For example, soils in Eastern Washington are low in zinc and applications of zinc-based fertilizers have shown improved crop yields. Many of Washington's fruit, vegetable, and row crops receive applications of zinc. When a particular metal such as zinc is used as a plant nutrient, the levels of that metal are allowed to exceed the Washington metals standards. Thus, the high levels of zinc in certain products listed in Appendix A are not cause for concern.

As WSDA staff reviewed applications for registration in 1998 and 1999, it became clear that certain fertilizers were more likely to have problems meeting the standards than others. These products include: iron and zinc fertilizers derived from metals processing waste; liming materials derived from wood ash; and certain phosphate fertilizers. Table 1 lists fertilizer materials which frequently contain high levels of metals. There are also a number of home and garden-use products that are close to or do not meet the metals standards. This is usually due to a specific nutrient source with high metals levels (e.g. certain rock phosphates), but is frequently compounded by very high application rates.

Table 1. Fertilizers Which Commonly Have High Metals Levels

Fertilizer Material	Metals of Concern
Rock phosphates	Cadmium, Selenium
Ferrous sulfates	Nickel, Lead
Zinc sulfates	Lead
Wood ash	Arsenic, Lead
Processed leather meal	Mercury

Some companies have reformulated their products and/or revised application rates in order to meet Washington metals standards. Table 2 lists common issues with fertilizers that fail to meet the Washington metals standards. Table 3 lists specific examples of products that failed to meet the Washington metals standards but made modifications to gain compliance.

Table 2. Common Issues and Resolutions for Products Failing Metals Standards

Issue (Why product failed standards)	Resolution
Application rate	Company can: <ul style="list-style-type: none"> • lower application rate • clarify application rate
High metals content	Company can reformulate product using different ingredients

Table 3. Specific Examples of Products with Metals Issues

Product	Issue	Resolution
Manganese Sulfate (31%)	Product failed standards at the application rate of 200 lbs/acre/year	Company reduced rate to 60 lbs/acre/year.
*10-20-20 with 7% Sulfur; 10-20-20; 15-12-12; 16-16-16	Product failed standards using the Washington application rate **	Company revised label to include maximum application rate .
Ironite	Product failed standards at application rate of 1.5 lbs/100 sq. ft	Company reduced rate to 1.5 lbs/1,000 sq. ft/year.
Systemic Rose, Shrub & Flower Care 6-10-4; Natural Organic Flower and Fruit Booster	Product failed standards due to high metals levels	Company reformulated, removed component from formulation, or used a component from a different supplier.

*The three numbers indicate grade, e.g. 10-20-20. The grade represents the percentage of total nitrogen (10%), available phosphoric acid (20%) and soluble potash (20%) guaranteed to be found in a fertilizer.

** WAC 16-200-7063 states, in essence, that when a fertilizer product's label does not contain an application rate, the Washington application rates are used which were defined to represent soil, climatic conditions and crop rotations in Washington state.

Registration Status

As of December 27, 1999, WSDA had received applications for the registration of 2,789 fertilizer products for the registration period that began July 1, 1999. WSDA has processed the applications for 2,608 products (93.5%). Ninety-three products have been denied registration. Sixty-three of the 93 were denied for failing to meet the metals standards (2.4% of all products

evaluated by WSDA). The remaining products were denied for failure to submit the appropriate metals data, a complete application, and/or proper labels.

A number of the 93 products denied registration have come into compliance, submitted new applications, and are now registered. For the most part, the products that failed standards were anticipated by the WSDA. Some products that failed standards, however, were a surprise. Certain organic products (such as manure and peat moss) and other products (such as potting soils) occasionally failed standards. In general, this was due to very heavy application rates rather than excessively high concentrations of metals in the product.

It does not appear that the new registration requirements of Washington's fertilizer law have had a significant impact on the number of products that are being registered in the state. In 1997, the last year prior to implementation of the standards, WSDA registered 2,332 fertilizer products. As of December 27, 1999, WSDA had registered 2,160 products with approximately 360 products still under review by either WSDA or the Department of Ecology.

Table 4. Fertilizer Product Registration Summary, as of 12/27/99

Category	Number
Number of products submitted	2,789
Number of products processed by WSDA	2,608
Number of products pending review by WSDA	181
<i>Breakdown of Products Processed by WSDA</i>	
Number of products registered	2,160
Number of products denied registration	93
Number of products sent Notice of Intent to cancel registration	10
Number of products withdrawn	25
Number of products returned for insufficient applications	138
Number of products pending Dept. of Ecology review	182

Field Sampling of Fertilizers for Metals Content

In addition to the metals analyses submitted by fertilizer companies, WSDA conducts a routine sampling program to monitor fertilizers for their metals content. Samples are taken by WSDA staff and analyzed by a private laboratory under contract with WSDA. Appendix B lists all samples analyzed between July 1, 1998, and October 31, 1999. A total of 62 fertilizers were sampled and analyzed. Using the data collected and the application rates, 54 products sampled met the Washington standards for all nine metals. Of the remaining eight products, seven could not be evaluated for all metals at desirable levels because of instrument interference, and the eighth has since been reformulated with different (cleaner) source material.

Review of Waste-Derived and Micronutrient Fertilizers

State law requires that, as of July 1, 1999, the Department of Ecology must review all registration applications for waste-derived and micronutrient fertilizers (RCW 15.54.330(4)). Appendix C is a summary of the 180 products that had been reviewed by Ecology as of mid-November 1999. At that time, approximately another 174 waste-derived or micronutrient fertilizer applications had been received by Ecology and were in the review process. They are not included in this report. To date, all products but one have passed the Ecology review. This product was withdrawn from registration.

To review registration applications for waste-derived and micronutrient fertilizers, Ecology developed a set of criteria that set maximum levels for leachable metals, halogenated organic compounds, and polycyclic aromatic hydrocarbons in these fertilizers. However, products that exceeded the maximum allowable levels in these criteria passed Ecology's review if it could be conclusively shown that no hazardous wastes were used to manufacture the product. Detailed information on the analytical test results for each fertilizer product reviewed by Ecology can be found on Ecology's web site at <http://www.wa.gov/ecology/hwtr/fertilizer/>.

WSDA and/or Ecology have reason to believe that nine products currently registered by WSDA as non-waste-derived products may, in fact, be waste-derived and therefore should provide the additional test data (leachable metals, halogenated organic compounds, and polycyclic aromatic hydrocarbons) required of waste-derived products. Ecology will be investigating these products and determining if additional information or other requirements are appropriate for these products on a case-by-case basis.

It should be noted that Ecology did not review waste-derived and micronutrient fertilizer registration applications that were determined by the Department of Agriculture to be unable to meet the Washington metals standards. These registration applications were denied by the Department of Agriculture prior to Ecology's review process.

Summary

The Fertilizer Regulatory Act of 1998 has given Washington State the ability to protect human health and the environment by limiting heavy metals application to soil. Implementation of the Act has resulted in identifying and removing unacceptable levels of metals and other potential waste-derived chemicals from fertilizer materials in Washington State. Washington is the first state to enact such a law. Texas has adopted rules setting metals standards for biosolids, California has proposed rules setting standards for three non-nutritive metals (arsenic, cadmium, and lead) in fertilizers, and other states are considering actions to tighten controls over fertilizers. Nationally, the United States Environmental Protection Agency (EPA) recently issued a risk assessment of fertilizer use in the United States. The study indicated that there was potential for contaminants in certain liming agents and micronutrient fertilizers. Washington's fertilizer law monitors all chemicals of concern indicated by the EPA risk assessment. The study concluded that, overall, no increased risk is associated with fertilizers when used as directed.

* **Note:** Waste-derived products determined by Ecology to be organic or natural in composition were not required to provide the analytical test data (leachable metals, halogenated organic compounds, and polycyclic aromatic hydrocarbons). This exception to the requirement for analytical test data was limited to products containing materials such as bone meal, blood meal, feather meal, etc. Instead, these products were required to disclose a complete list of all components and their sources as well as a general description of the manufacturing process for the product. This allowed Ecology to make a determination as to whether or not a potential hazardous waste may have been used in the production of these products without requiring the registrants of these products to undergo analytical testing. The test requirements were designed to determine if waste-derived fertilizers containing an industrial waste or other secondary material may be a hazardous waste requiring further regulation. Waste-derived fertilizers from organic sources were not intended to be subjected to that level of scrutiny.
